Editor's Note: For 2021, NASF-AESF Foundation Research Board has selected a project on addressing the problem of PFAS and related chemicals in plating wastewater streams. This report covers the fourth quarter of work (October- December 2021). A printable PDF version of this report is available by clicking [HERE](#).

Introduction

This project started in January 2021 with the goal of developing applicable electrochemical approaches to remove per- and polyfluoroalkyl substances (PFASs) present in plating wastewaters, including electrooxidation (EO) and electrocoagulation (EC). This project includes three research tasks that are designed to investigate EC, EO and EC-EO treatment train, respectively, designed to probe three hypotheses specified follows:

- 1) EC generates amorphous metal hydroxide flocs that can effectively adsorb PFASs in plating wastewater, which, through an appropriate treatment, can release PFASs into a concentrated solution.
- 2) EO enabled by a Magnéli phase Ti_4O_7 anode can be used to effectively destruct PFASs in plating wastewater.
- 3) The electrochemical treatment train comprised of EC and EO by Ti_4O_7 anode can remove and degrade PFASs in plating wastewater more efficiently than either process operated individually.

The results reported in the previous reports of this project demonstrated the feasibility of a novel treatment train that combines electrocoagulation (EC) with electrooxidation (EO) treatment to remove and degrade per- and polyfluoroalkyl substances (PFASs) from plating wastewater. Electrocoagulation with a zinc anode can effectively remove PFASs from water, particularly the long-chain PFASs ($C_7 - C_{10}$) that are present in plating wastewater, by concentrating them on the flocs or in the foams generated during EC. Both the flocs and the foams can be dissolved by acid to recover and concentrate the PFASs in controlled volumes. The concentrated PFASs in the acid solutions were efficiently destroyed using EO treatment with a Ti_4O_7 anode at 10 mA/cm², and no supplemental electrolyte was needed for the flocs dissolved in solution. This electrochemical-based EC-EO treatment train can likely economically separate, concentrate and destroy PFASs in plating wastewater.

This report describes our continuing effort in Task 3. First, we calculated the energy consumption of the EO treatment process in terms of EE/O that is defined as the electrical energy required to reduce the concentration of a pollutant by one order of magnitude (kWh/m³).¹ Second, we evaluated means to remove residual zinc ions that may exist after the EO treatment of the acid dissolved solution of zinc flocs.

Experimental

Calculation of EE/O was based on the results of the experiment of EO treatment reported earlier, which is presented in Fig. 2 in the 3rd report.² In that experiment, three different concentrated solutions prepared through the electrocoagulation (EC) process were subjected to electrooxidation (EO) treatment using Magnéli phase Ti₄O₇ anodes at the current density of 10 mA/cm². Solution I was the acid dissolved solution of PFASs-laden floc generated using a low current density condition after 120 min (0.3 mA/cm², 0.005 μM each of 10 PFASs). Solution II was the acid dissolved PFASs-laden floc solution obtained through EC treatment under the high current density condition after 60 min (5 mA/cm², 0.5 μM each of 10 PFASs). The foam collected during this EC process was supplemented with 20 mM Na₂SO₄ to a final volume of 10 mL as Solution III.

An experiment was performed to assess the methods of removing zinc ions from the solution produced by acid dissolution of the zinc hydroxide flocs generated during the EC process. Specifically, removal of zinc ions was achieved by precipitation with the addition of Na₂S or Na₂CO₃. In this experiment, EC was first conducted in a 20-mM Na₂SO₄ solution with PFASs at 0.3 mA/cm² for 120 min or at 5 mA/cm² for 60 min. The entire solution, including flocs, was then collected and filtered through a 0.22-μm acetate membrane filter. The EC flocs from both current density conditions were then collected and dissolved in 10 mL 4.0M H₂SO₄, respectively. Na₂S or Na₂CO₃ was then added to the solution at different dosages. The concentration of Zn²⁺ in the solution was determined using an ICP-MS (Perkin Elmer Elan 9000 inductively coupled plasma equipped with a mass spectrometer),³ with a detection limit of 0.05 mg/L.

Results and discussion

The EE/O (kWh/m³) of PFAS degradation in the three solutions described above was calculated by equation 1,¹

$$EE/O = \frac{U_{cell} I}{V} t_{90\%} \quad (1)$$

where U_{cell} is the average cell voltage during EO treatment (V), I is the applied current (A), V is the volume of the reaction solution (L). $t_{90\%}$ is the time (hr) for 90% PFAS removal that was calculated by equation 2:

$$t_{90\%} = \ln\left(\frac{C}{C_0}\right) / 60k \quad (2)$$

where C/C_0 is 10% and k (min⁻¹) is the pseudo-first-order rate constant for the degradation of different PFASs in the three solutions that was obtained by fitting the data of PFAS degradation, presented in Fig. 1 of the 3rd report,² to the pseudo-first-order rate model, which are listed in Table 1.

The calculated EE/O values of PFASs degradation in concentrated solution are shown in Table 2. The EE/O varies from 0.34 to 15.7 kWh/m³ for different PFASs in different solutions. It appears that the EE/O was lower for the long-chain PFAS, *e.g.*, PFNA, PFOA, PFOS, than the shorter ones, *e.g.*, PFBS and PFHxA. It is notable that the EE/O for the PFASs frequently present in plating wastewater is particularly low, for example, it was 0.66 (kWh/m³) for 6:2 FTS, 0.55 (kWh/m³) for PFOS, and 0.95 (kWh/m³) for PFOA in solution I. Such EE/O levels are considered favorable for applications in wastewater treatment.

The result of the experiment to assess the methods of removing zinc ions from the solution by precipitation with the addition of Na₂S or Na₂CO₃ is shown in Figure 1. It is apparent that the zinc concentration remaining in the solution decreased dramatically as the added Na₂S or Na₂CO₃ increased, because of the precipitation of ZnS or ZnCO₃. Nearly all dissolved Zn²⁺ was precipitated out when sufficient salts had been added. This proves that chemical precipitation can be used as an effective means to remove the residual zinc in the final effluent of the proposed EC-EO treatment train.

Project R-122 Q4

Table 1 - The pseudo-first-order rate constant (min^{-1}) of PFASs in concentrated solution in EO process.

Compound	Solution I	Solution II	Solution III
PFNA	0.4156	0.0996	0.1807
PFOA	0.2334	0.0891	0.1633
PFHpA	0.1965	0.0506	0.0889
PFHxA	0.0546		0.0232
PFOS	0.4064		0.1504
PFHxS	0.2550	0.0602	0.1109
PFBS	0.0499		0.0144
8:2FtS	0.6567		0.0324
6:2FtS	0.3387	0.2457	0.2073
4:2FtS	0.1234		0.3744

Table 2 - EE/O (kWh/m^3) for PFASs degradation in concentrated solution during EO process.

Compound	Solution I	Solution II	Solution III
PFNA	0.54	1.43	1.25
PFOA	0.95	1.59	1.39
PFHpA	1.13	2.81	2.55
PFHxA	4.07		9.76
PFOS	0.55		1.51
PFHxS	0.87	2.36	2.04
PFBS	4.46		15.7
8:2FtS	0.34		6.99
6:2FtS	0.66	0.58	1.09
4:2FtS	1.80		0.60

Figure 1 - Concentration of zinc ions in the solution at different current densities and with Na₂S or Na₂CO₃ added at different dosages.

About the author

Qingguo (Jack) Huang is Professor in the Department of Crop and Soil Sciences, University of Georgia, Griffin Campus. He holds a B.S. in Environmental Science (1990) and a Ph.D. in Chemistry (1995) from Nanjing University, China as well as a Ph.D. in Environmental Engineering from the University of Michigan, Ann Arbor, Michigan. Dr. Huang's research interest focuses on catalysis involved in the environmental transformation of organic pollutants, and development of catalysis-based technology for pollution control and environmental remediation and management. His laboratory has been actively involved in several cutting-edge research topics:

- Enzyme-based technology for water/wastewater treatment and soil remediation
- Electrochemical and reactive electrochemical membrane processes in wastewater treatment
- Catalysis in biofuel production and agro-ecosystem management
- Environmental fate and destructive treatment methods of PFASs
- Environmental application and implication of nanomaterials

He has published over 160 peer-reviewed journal articles, five book chapters and four patents and three patents pending. He has taught three courses at the University Georgia: Introduction to Water Quality, Environmental Measurement, and Advanced Instrumental Analysis in Environmental Studies.
